Motivation

- New state space of a delete-free task Π^+
- Compute h^+ in this new state space
- Use it to solve Π⁺

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments 0000000 Conclusion

Delete-Free Planning

In a delete-free planning task Π^+ we have:

- a set of facts;
- a set of actions in the format $a = (pre_a, add_a)$;
- a cost function;
- a initial state s₀; and
- a set of goal facts;

Relaxed Decision Diagrams

Experiments

Conclusion

Variable Assignment Problems

- Given a set of variables V
- Assign each variable to a value
- Some assignments are solutions
- Every assignment has a cost

Experiments

Conclusion

Decision Diagrams

- a graph G divided in n layers L_1, L_2, \ldots, L_n
- a root node r and a terminal node t
- a set of variables V with finite domain D_v for all $v \in V$
- a cost function $w: V \times D_v \to \mathbb{R}$

Π⁺ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Decision Diagrams

- a graph G divided in n layers L_1, L_2, \ldots, L_n
- a root node r and a terminal node t
- a set of variables V with finite domain D_v for all $v \in V$
- a cost function $w: V imes D_v o \mathbb{R}$

Remark

Two nodes in a same layer can select different variables to assign.

How to represent Π^+ as a decision diagram?

 Π^+ as a Decision Diagram $\bullet \circ \circ \circ \circ \circ \circ$

Relaxed Decision Diagrams

Experiments 0000000 Conclusion

How to represent Π^+ as a decision diagram?

- The set of actions A is the set of variables
- Assign each action to 0 or 1
- Each node represents a state*
- A path from r to t is a plan
- Cost of a plan = cost of the actions assigned to 1

 Π^+ as a Decision Diagram $0 \bullet 0 \circ 0 \circ 0$

Some Caveats

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments 0000000 Conclusion

Some Caveats

- Merge nodes representing goal states into t
- A path from r to t represents a partial assignment

 Π^+ as a Decision Diagram 000000

Relaxed Decision Diagrams

Experiments

Conclusion

Selecting an Applicable Action

An action $a \in A$ can be selected by a node g iff:

 Π^+ as a Decision Diagram $\circ \circ \circ \circ \circ \circ \bullet$

Relaxed Decision Diagrams

Experiments

Conclusion

Selecting an Applicable Action

An action $a \in A$ can be selected by a node g iff:

- a is not forbidden: $a \notin N(g)$
- a is applicable: $pre_a \subseteq F(g)$
- a is not useless: $\operatorname{add}_a \nsubseteq F(g)$

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Relaxed Decision Diagrams

- Decision diagrams can be exponentially large
- We can create a relaxed version with bounded size

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Limited Width

- Limit the width (number of nodes) of the layers to ω
- If $|L_i| > \omega$, we combine nodes on L_i
- We need to find a good way to combine the nodes

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Limited Width

- Limit the width (number of nodes) of the layers to ω
- If $|L_i| > \omega$, we combine nodes on L_i
- We need to find a good way to combine the nodes

Two conditions (for minimization problems)

- All solutions to the original problem must be preserved
- No solution cost can be overestimated

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Limited Width

- Limit the width (number of nodes) of the layers to ω
- If $|L_i| > \omega$, we combine nodes on L_i
- We need to find a good way to combine the nodes

Two conditions (for minimization problems)

- All solutions to the original problem must be preserved
- No solution cost can be overestimated

If both conditions hold, then the combination is admissible

Relaxed Decision Diagram for Π^+

- How to combine nodes in a same layer?
- Combine a pair of nodes u, v into a single node w

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Relaxed Decision Diagram for Π^+

- How to combine nodes in a same layer?
- Combine a pair of nodes *u*, *v* into a single node *w*
- Use the following combination function

$$F(w) = F(u) \cup F(v)$$
$$N(w) = N(u) \cap N(v)$$

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Relaxed Decision Diagram for Π^+

- How to combine nodes in a same layer?
- Combine a pair of nodes u, v into a single node w
- Use the following combination function

$$F(w) = F(u) \cup F(v)$$
$$N(w) = N(u) \cap N(v)$$

Theorem

This combination function is admissible.

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments 0000000 Conclusion

Relaxed Decision Diagram for Π^+

- How to combine nodes in a same layer?
- Combine a pair of nodes u, v into a single node w
- Use the following combination function

$$F(w) = F(u) \cup F(v)$$
$$N(w) = N(u) \cap N(v)$$

Theorem

This combination function is admissible.

Observation

The shortest path from r to t is a lower bound for h^+ .

Relaxed Decision Diagrams

Experiments

Conclusion

Hamming Distance w/ $\omega = 128$ vs h^+

Introduction 00000	Π ⁺ as a Decision Diagram 0000000	Relaxed Decision Diagrams	Experiments 0000000	Conclusion
	С			

How many instances we could find an optimal plan?

	h^+	$\omega = \infty$	$\omega = 64$	$\omega = 128$	$\omega = 256$	$\omega = 512$	$\omega = 1024$
# valid plans (1667)	921	171	135	155	146	130	122
# of domains (57)	55	28	21	28	28	23	19

 Π^+ as a Decision Diagram

Relaxed Decision Diagrams

Experiments

Conclusion

Selecting Random Nodes

- change the nodes selection function to a random selection
- results report the avg. over 10 runs
 - only for $\omega = \{128, 256\}$
- with $\omega = 128$ the number of optimal plans drops to 131.4
- with $\omega = 256$ the number of optimal plans drops to 139.9

Conclusion

Contributions:

- Proposed a new state space representation for delete-free tasks
- Analyzed theoretically some properties of this new state space
- Experiments showed this technique is not yet informative

Future Work:

- Better strategies for action selection
 - e.g., greedily select landmark actions whenever possible
- Better strategies for node selection
 - e.g., consider g-values to avoid "shortcuts"
- Refinement strategies
 - e.g., start with a diagram with width equals to 1 and split combined nodes
